⌕

Write a Python program to accept three digits and print all possible 3-digit combinations that can be formed using those three digits. Each digit should be used exactly once in each combination.

For three digits a , b , and c , there are 6 possible arrangements based on their indices: abc , acb , bac , bca , cab , cba .

Input Format:

• Single line contains three space-separated non-negative integers, a , b , and c , representing the three digits

Output Format:

• Print all possible 3-digit combinations

• Each combination should be printed as a 3-digit number on a separate line

• Print combinations as they appear (maintain leading zeros if first digit is 0)

Constraints:

• $0 \leq \text{each digit} \leq 9$

• Digits can be same or different
