

Experiment 14.1.1

Name – Yashwardhan Chourasia

Prn – 25070521167

Algorithm –

1. Start
2. Read two integers real1 and imag1 (first complex number)
3. Read two integers real2 and imag2 (second complex number)
4. Compute:
5. $\text{real} = \text{real1} + \text{real2}$
6. $\text{imag} = \text{imag1} + \text{imag2}$
7. If $\text{imag} \geq 0$
8. Print: $\text{real} + \text{imag } i$
9. Else
10. Print: $\text{real} - |\text{imag}| i$
11. End

Flowchart –

14.1.1. Complex Number Addition using Class

06:43 A C D ? -

Write a Python program using a class named **Complex** to add two complex numbers.

Create a class **Complex** with the following methods:

- **initComplex()**: Read user input for the real and imaginary parts.
- **sum()**: Compute the sum of two complex numbers and store the result in the current instance.
- **display()**: Display the complex number in the format "<a> + i" or "<a> - i".

The program should create three instances of **Complex** class: two for input complex numbers and one for the result. Initialize both complex numbers, compute their sum, and display the result.

Input Format:

- First line contains two space-separated numbers: real and imaginary parts of first complex number
- Second line contains two space-separated numbers: real and imaginary parts of second complex number

Output Format:

- Print a single line showing the sum of the two complex numbers in the format "<a> + i" or "<a> - i".

Sample Test Cases

+

complex...

```
1 class Complex:
2     # Write the code.....
3     def initComplex(self):
4         self.real, self.imag = map(int, input().split())
5     def sum(self, c1, c2):
6         self.real = c1.real + c2.real
7         self.imag = c1.imag + c2.imag
8     def display(self):
9         if self.imag >= 0:
10             print("{}{} + {}".format(self.real, self.imag, self.imag))
11         else:
```
