7.1.2] Possible Combinations from three Digits

Step 1: Start

Step 2: Read three space-separated digits a, b, and c

Step 3: Store the digits as strings

Step 4: Print a + b + c

Step 5: Print a + c + b

Step 6: Print b + a + c

Step 7: Print b + c + a

Step 8: Print c + a + b

Step 9: Print c + b + a

Step 10: Stop

B) PYTHON CODE

```
a, b, c = input().split()
```

```
print(a + b + c)
```

```
print(a + c + b)
```

```
print(b + a + c)
```

```
print(b + c + a)
```

```
print(c + a + b)
```

```
print(c + b + a)
```

7.1.2. Possible Combinations from Three Digits

12:45

Write a Python program to accept three digits and print all possible 3-digit combinations that can be formed using those three digits. Each digit should be used exactly once in each combination.

For three digits a , b , and c , there are 6 possible arrangements based on their indices: abc , acb , bac , bca , cab , cba .

Input Format:

- Single line contains three space-separated non-negative integers, a , b , and c , representing the three digits

Output Format:

- Print all possible 3-digit combinations
- Each combination should be printed as a 3-digit number on a separate line
- Print combinations as they appear (maintain leading zeros if first digit is 0)

Constraints:

- $0 \leq \text{each digit} \leq 9$
- Digits can be same or different

Sample Test Cases

combinat...

1 $a, b, c = \text{input().split()}$

2

3 $\text{print}(a + b + c)$

4 $\text{print}(a + c + b)$

5 $\text{print}(b + a + c)$

6 $\text{print}(b + c + a)$

7 $\text{print}(c + a + b)$

8 $\text{print}(c + b + a)$

Average time
0.002 s
